AspireX

PROJECT CHARTER | Intelligent Career Readiness & Skills Gap Analysis Platform

Project information	Details
Project name	AspireX
Project type	Technical Business Analysis Portfolio Case Study
Project owner / BA	Kaveesha Devindi
Approval	Self-directed portfolio; no external sponsor approval

1. Project Overview

AspireX is a proposed career readiness platform for university students and fresh graduates. It is designed to compare users' existing skills with sample skill requirements for target careers, identify gaps, recommend learning resources, and support progress tracking.

2. Problem Statement

Students and fresh graduates may struggle to understand the skills needed for their preferred careers and to assess where their current skills fall short. This can make career planning and learning choices difficult. These challenges are assumptions for this fictional case study, not findings from completed user research.

3. Purpose and Objectives

Purpose: Design a clear, accessible platform concept that helps early-career users make informed learning and career-preparation decisions.

- Identify the skills associated with selected target career paths.
- Compare a user's declared skills with sample role requirements.
- Highlight skill gaps and suggest relevant learning resources.
- Show career-readiness indicators and learning progress.
- Define Power BI reporting requirements and visualize aggregate skill-gap and career-preference trends using synthetic data.

4. Proposed Scope

In scope

- User account and profile concept; skills entry
- Target career selection and sample role requirements
- Skill gap analysis and career readiness dashboard
- Learning recommendations and progress tracking

- Power BI dashboard prototype using synthetic sample data; KPI definitions, data mapping and report validation.
- BA artifacts: requirements, process models, business rules, traceability, API specification and UAT cases.

Out of scope

- Direct job applications or guaranteed job placement
- Online interviews, payments, or course hosting
- Production deployment or a trained AI model within the seven-day case study

5. Budget and Resources

Budget: No organizational budget is allocated. The case study will use existing personal equipment and free or available tools; any new costs will be documented if incurred.

Resources: Laptop, Microsoft Word, Figma, diagrams.net (draw.io), GitHub, and clearly labeled sample career/skills data.

6 Deliverables and Success Criteria

Deliverables: Charter, stakeholder analysis, BRD, requirements, user stories, BPMN/use case/ERD diagrams, Figma prototype, API specification, RTM, UAT test cases, and final case-study summary.

- Problem, objectives, stakeholders, and boundaries are clear and consistent.
- Prototype illustrates the core flow from skills entry to skill-gap results.
- Requirements can be traced to proposed design elements and tests.
- Power BI dashboard shows at least three defined KPIs; figures reconcile with the synthetic dataset.
- Documents are organized and suitable for publication as a portfolio case study.

7. Approval and Disclaimer

Prepared by: Kaveesha Devindi | Role: Business Analyst / Project Owner | Approval: Not formally approved.

AspireX is a fictional portfolio case study. Stakeholder scenarios, business assumptions, and proposed features have not been validated with real clients. No production-ready software or implemented AI capability is claimed.
