AspireX
Business Requirements Document (BRD)

1. Executive Summary

AspireX is a proposed career-readiness and skills-gap analysis platform for university students and fresh graduates. It would allow users to select a career, record current skills, compare them with illustrative role requirements and identify areas for improvement. A supporting Power BI report would summarize fictional, aggregated sample data for portfolio demonstration.

2. Business Problem & Opportunity

Students may struggle to understand role-specific skill requirements, identify personal skill gaps and prioritize learning. Career guidance teams may also lack a consolidated view of recurring gaps. These problems are assumptions informed by fictional personas and simulated interviews, not validated research findings.

3. Business Objectives

- Help learners understand skills expected for selected sample careers.
- Make skill gaps visible through a transparent, explainable comparison.
- Support prioritization of learning and optional progress tracking.
- Demonstrate aggregate insights with synthetic data in Power BI.

4. Scope

In scope: business analysis artifacts; role and skill catalog assumptions; user skill profile and career selection concepts; skill comparison rules; learning recommendation concept; optional progress tracking; Figma clickable prototype; synthetic-data Power BI report and proposed UAT cases.

Out of scope: deployed production application, live job listings or applications, real recruitment decisions, payment processing, course hosting, trained AI model, and claims of verified employment readiness.

5. Stakeholders

Stakeholder	Interest / Need
Student / Fresh Graduate	Understand skill requirements and gaps.
Career Advisor	Help learners interpret gaps and plan development.
Career Guidance Analyst	View privacy-preserving aggregate insights.
System Administrator (proposed)	Manage access and reference skill catalog.
Project Owner / BA	Define scope, rules, prototype and validation approach.

6. Business Requirements

Business Requirement	Priority
Enable learners to understand target-career skill expectations.	Must
Enable learners to identify gaps against selected role requirements.	Must
Support planning and tracking skill development.	Should
Provide aggregated sample career-readiness insights for analysis.	Should

7. High-Level Functional Requirements

Requirement	Priority
Allow user registration and login in the proposed platform.	Must
Allow users to create or update a skills profile.	Must
Allow users to select a target career.	Must
Compare user skill levels with required levels for that career.	Must
Show missing / improvement / met status and a requirements-match score.	Must
Suggest learning resources based on identified gaps.	Should
Allow users to record learning progress.	Should
Show aggregated synthetic-data reports in Power BI.	Should

8. Non-Functional Requirements (Proposed)

- Authenticated access and protection of individual profiles.
- Responsive, understandable interface for mobile and desktop.
- Display comparison results within 3 seconds under agreed test conditions (target only).
- Do not disclose identifiable individual profiles in aggregate reports.
- Clearly label readiness scores as illustrative requirement matches, not employability predictions.

9. Business Rules & Calculation

- A target career must be selected before gap analysis.
- Skill levels use ;None=0, Basic=1, Intermediate=2, Advanced=3.
- Current level 0 = Missing; current below required = Needs Improvement; current at/above required = Requirement Met.
- Requirements-match score = (number of required skills met / total required skills) x 100; only defined, required skills count.
- If no required skills are defined, show score unavailable rather than divide by zero.

10. Assumptions, Constraints & Dependencies

Assumptions: fictional personas and simulated interview statements represent possible needs; career skills are sample requirements, not verified labor-market standards. Constraints: short portfolio timeline, no access to real respondent data, no production deployment. Dependencies: consistent career-skill catalog, documented level definitions, synthetic dataset and Power BI model.

11. Success & Acceptance Criteria

Measure	Proposed acceptance criterion
Traceability	Every high-level requirement maps to at least one design artifact or test scenario.
Core journey	Clickable prototype demonstrates career selection, skill entry and gap result.
Rule consistency	Sample scenarios produce expected Missing / Improvement / Met classifications and scores.
Analytics	Power BI report shows reproducible measures from clearly labeled synthetic data.
Disclosure	Portfolio identifies assumptions, unvalidated claims and unimplemented features.

12. Risks & Mitigations

Risk	Mitigation
Unvalidated user needs	Label assumptions and recommend later real-user interviews.
Misleading readiness score	Describe score as illustrative skills match only.
Synthetic data interpreted as real	Label dataset, visuals and case study as synthetic.
Time pressure	Prioritize core user journey and minimum viable dashboard.
